ABSTRACT

The lack of spaces or facilities that can accommodate youth activities and activities is the background for the youth center design project in Bandar Lampung. Because the interests and talents of teenagers are not channeled properly. Therefore, it is planned to build a youth center that facilitates arts, sports, and education activities. This youth center project is managed by the Bandar Lampung City Government whose land is located on Jalan Arief Rahman Hakim, Way Dadi, Sukarame, Bandar Lampung with a land area of 17.5 Ha, but only 1.5 Ha is used. The position of the land in the middle of the urban forest makes the building integrated with the urban forest. By paying attention to issues related to design, namely circulation issues that are designed to be easily accessible and interconnected between the spaces inside the building and the outside of the building, the flexibility of space is designed with walls that can be opened, recreation is designed to provide colors that match the characteristics of teenagers, and the issue of urban forest that designed as a green open space and natural ventilation in the land. The results of the design have a circular building shape with the amphitheater in the middle of the building as a center for performance activities for teenagers, so that visitors who want to see the show can enter the building first. The outdoor space is designed around the building with the intention of inviting visitors who come to enjoy the facilities available in the youth arena. The design of the youth arena building consists of 2 building masses. Building A has 2 floors and building B has 3 floors with a total building area of 7,137.35 m².
